

Atcash is a technology company that builds and operates identity and remote trust solutions. In these unprecedented times, remote solutions have become critical. People are demanding an alternate to face-to-face meetings. This is especially true for non-essential services.

Identity, though often talked about, is still the Achilles heel for most businesses. Capturing consent and evidence is also equally important in protecting businesses and consumers.

Atcash has solved the issue of remotely verifying identity, getting consent, capturing evidence and even notarizing documents through its technology platform. The platform is called TIME or Trust and Identity Management Engine. TIME is modular and can be implemented end-to-end or piece-meal.

TIME Modules

TIME for identity:

Our identity verification module includes ID document verification, liveness detection, facial recognition, social security verification, knowledge-based-authentication and other verifications.

TIME for video evidencing:

Video evidencing supports onboarding and contracts on video. The technology allows a customer to connect with an agent based on specific workflow triggers and routing rules.

TIME for contracts:

The contracts modules enables e-signatures and contract automation. It enables contracts to be signed digitally and remotely.

TIME is built atop open source Hyperledger blockchain to validate and authenticate credentials and store data on blockchain. Our blockchain optional layer can build powerful solutions involving multiple parties including customers and industry members.

Use Cases

Our platform is flexible and customizable. Our workflow driven architecture allows us to easily adapt use cases and configure parameters for various use cases. We enable several use cases including digital onboarding, identity-as-a-service, remote notarizations and many more.

Our notary platform Atnotarize is an example of how TIME has been customized for contracts on video/ notarization use case.

TIME can also be used for identity-as-a-service. Identity is verified once and becomes one single source of truth that is accessible by various parties. The consumer has ultimate control over who they authorize to view their information.
